

A scatter plot showing the RGB Weight w_{rgb} (X-axis, ranging from 0.3 to 0.9) versus Loss (Y-axis, ranging from 0.0 to 1.0). The plot displays data points for three models: P3 (High-res, red circles), P4 (Mid-res, blue circles), and P5 (Low-res, green circles). The P3 data points are widely distributed across the plot, with a notable cluster at high loss and low weight, and another at low loss and high weight. The P4 and P5 data points are more tightly clustered, primarily in the region of low loss and moderate weight.

A box plot showing the distribution of Cross-Modal Error for RGB and IR sensors across three age groups: P3, P4, and P5. The y-axis represents the Cross-Modal Error, ranging from 0.0 to 2.0. The legend indicates that RGB Error is represented by grey boxes and IR Error by red boxes. For P3, the RGB Error median is approximately 0.3, while the IR Error median is approximately 0.5. For P4, the RGB Error median is approximately 0.15, and the IR Error median is approximately 0.18. For P5, the RGB Error median is approximately 0.12, and the IR Error median is approximately 0.15. The plot shows that the error decreases as the age group increases, with P5 having the lowest error and P3 having the highest error.
